SUMMARY

Fresh graduate with a focus on data science, deep learning, and computer vision, graduating with a GPA of 3.9 from the D4 Informatics Management program at Universitas Negeri Surabaya. Experienced in building a plant disease classification model using DenseNet201, deployed as a mobile application, as well as a sentiment analysis system for Tokopedia reviews using the IndoBERT model, presented as an interactive web dashboard. Skilled in data processing and building applied deep learning models using Python, TensorFlow, and NumPy.

EXPERIENCE

BADAN PUSAT STATISTIK KABUPATEN TRENGGALEK – Trenggalek, Indonesia

Pengolahan Data (*Januari 2025 – Juli 2025*)

- Developed a web scraping tool using Python and Selenium to collect data from 1,500+ schools (PAUD to SMA level) across Kabupaten Trenggalek, with automated export to Excel to accelerate data entry and school profiling by staff.
- Designed data visualizations and an administrative data dashboard for Desa Dawuhan, Kecamatan Trenggalek using Looker Studio, supporting transparent and publicly accessible data publication.
- Designed Excel-based data visualizations to streamline the compilation and presentation of statistical data for the "Kabupaten Trenggalek Dalam Angka 2025" publication.
- Built a web based public service queuing system using Laravel 10, digitizing a previously manual visitor management process into a more structured and efficient workflow.
- Performed regular entry and recapitulation of news related to Kabupaten Trenggalek to support regional documentation and information archiving.

PROJECT

Deep Learning Based Sugarcane Leaf Disease Detection System (*Final Thesis, July 2026*)

- Built an 11-class sugarcane leaf disease classification model based on DenseNet201 (Transfer Learning), using a combination of two public datasets and class weighting to address data imbalance
- Achieved 97% accuracy on 2,231 test samples, then deployed the model using TensorFlow Lite in a Flutter application, enabling offline inference directly on the user's device.

Tokopedia Review Intelligence — NLP Based Sentiment Analysis & Customer Complaint Classification (*July, 2026*)

- Built a Natural Language Processing (NLP) pipeline using IndoBERT on 1.18 million Tokopedia product reviews, with two separately fine-tuned models for sentiment analysis and multi-label complaint classification.
- The sentiment model achieved 73.2% accuracy, while the complaint classification model achieved a micro-F1 score of 0.80. Prediction results were presented through an interactive Flask based dashboard to help identify customer issues and support business decision-making.

SaveCerv AI — AI System for Early Cervical Cancer Detection through Pap Smear Image Analysis (*Team Project, Intel® AI Global Impact Festival*) (*July, 2025*)

- Contributed to developing a Pap smear image classification system using MobileNetV2 (Transfer Learning) to identify 5 cytology categories, achieving 90% accuracy on test data.
- Developed a Flask and Streamlit-based web application for real-time image analysis, equipped with confidence scores and a national and global cervical cancer statistics dashboard to support screening access in remote areas.

SKILLS

Programming Languages	: Python
Deep Learning	: Transfer Learning, Image Classification, Text Classification, Model FineTuning, TensorFlow, Keras
NLP	: Sentiment Analysis, IndoBERT, Text Classification.
Model Deployment	: Flask, Streamlit, TensorFlow Lite, Flutter
Data Preprocessing & Cleaning	: Model Evaluation, Data Cleaning, Pandas, NumPy, Scikit learn, Excel
Data Visualization	: Looker Studio, Excel
Tools	: Git, Jupyter Notebook, Anaconda

ORGANISATION

PKM CENTER UNESA (2024)

- Contributed to increasing the funded Program Kreativitas Mahasiswa (PKM) proposal success rate from 7.2% in 2023 to 9.6% in 2024 through administrative coordination and information dissemination to participants.

EDUCATION

UNIVERSITAS NEGERI SURABAYA (2022 – 2026)

- Bachelor of Applied in Informatics Management – GPA 3.90
- Program Dicoding for University – Data Science
